Ergonomics

21.5" LED up & down

90° foldable

Depth View

The LED screen can be rotated left and right -90°~90° allow different viewing angles of patients and operators

Stereo audio system

Floating keyboard with left/right rotation -45°~45°, up/down height adjustment

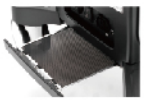
Backlit keys

Hero Kit

Innovative service solution

Quick• Easy• Reliable• Affordable

USB ports



Removable dust filter.

Built - in battery (option)

Print paper face to the front, for easy access

Small foot print

Four wheels with locks

Virtual HD

- The latest innovation in real-time 4D with powerful imaging engine.
- Greatly strengthen the bond between mother and fetus. With moveable virtual light source.

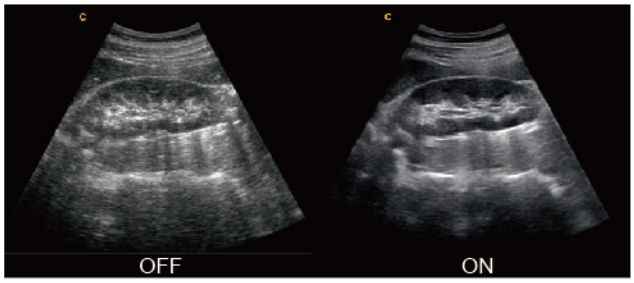
Advanced Technologies

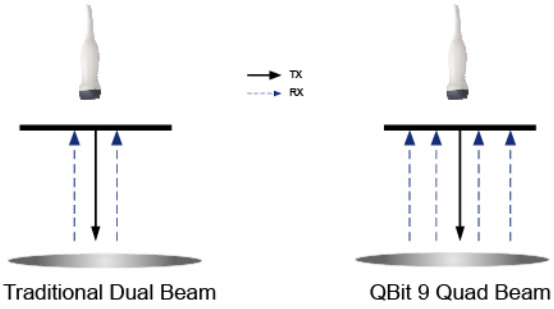
Q-image

- These innovative algorithms have strengthened the image enhancement results significantly.
- Advanced chipset is used to ensure fast frame rate.



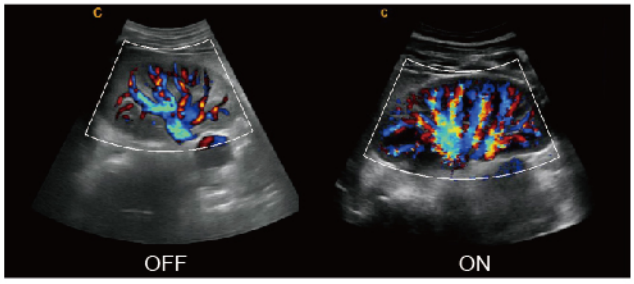
Q-beam

- Compared to the traditional dual-beam, QBit uses quad-beam to receive signal, thus doubles the volume of signal received as well as the frame rate.
- Higher frame rate ensures better diagnostic confidence and efficiency.



Q-flow

- This adaptive color detection technology can automatically adjust the assessment of color signal and noise according to different tissues.
- As a result, color sensitivity of low-velocity flow is greatly enhanced.



X-contrast

- Contrast resolution can be set at 3 different levels according to the tissue difference.
- Activated by one key: Enhance, Normal , Suppress.

FHI

- An innovative harmonic technology that uses different transmission and receives methods for different body-sized patients, to maximize the resolution without losing the penetration.
- Better than traditional THI and phased harmonic which compromise the penetration.
- This greatly helps to improve diagnostic confidence on big patients.

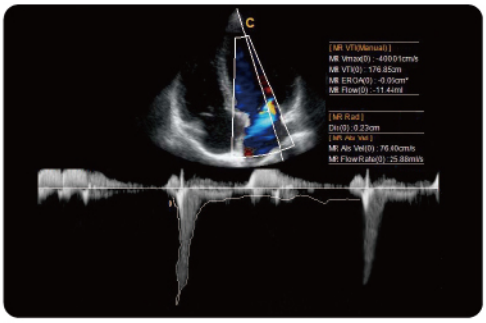
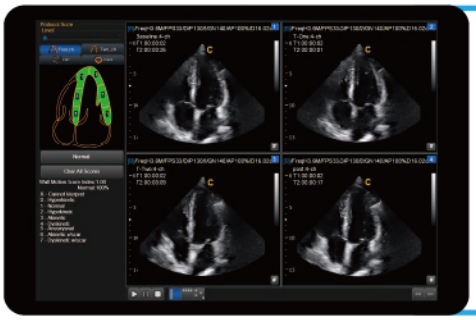
PISA

PISA is Proximal Isovelocity Surface Area, a method to look at flow convergence, to calculate severity of MR/TR/PR.



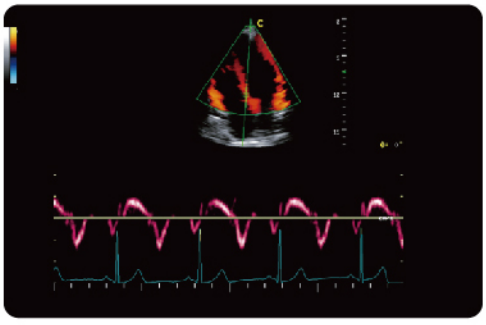


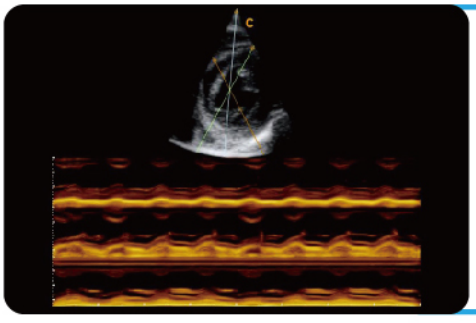
StressEcho

An echocardiogram is a painless, harmless test that uses high frequency sound waves to examine the heart's anatomy function.

Tissue Doppler Imaging (TDI)

Tissue Doppler imaging is a novel echocardiography technique that directly measures myocardial velocity. Systolic TD measurements assess left and right ventricular myocardial contractile function. Diastolic TD values reflect myocardial relaxation.





Free Steering M Mode

The cursor line can be rotated in 360 degree and placed at the desired position up to 3 lines can be used for simultaneous measurements.
